Context

Googlers rely upon a variety of accessories being readily available in order to keep them productive. Accessory Racks are the traditional means to allow Googlers to freely take a limited selection of accessories from racks that are placed in open spaces. In order for this solution to be effective, EMT keeps the racks stocked.

Purpose

The purpose of this process is to outline the EMT responsibilities in the proactive servicing of the legacy Accessory Rack solution.

Scope

Technicians use this document to understand the required actions to stock and record their actions in support of the Accessory Rack.

To make the best use of this playbook, you should be familiar with:

- GUTS tickets and the instructions contained in the **Description**.
- Bronco Bulk Process application.

Process

Technician Process

^

The intent is to perform 3 checks per day in most locations, and the tickets should be handled according to the established cadence (1 morning, 1 midday, 1 afternoon).

- Accessory Rack tickets are generated in GUTS based on the location of each rack.
 - Three tickets are generated each morning prior to the business hours of the location.
 - The [go/rackcheck](#) form is no longer required.
 - Work only tickets that are created with today's date.
 - Tickets have this common summary and description. (See image below).

Summary*

Accessory Rack Visit for US-AST-DAT2-Accessory Rack A **TEST/EXAMPLE**

Ticket Type

CorpEng Support [\[Change Ticket Type\]](#)

Description*

** TEST TICKET – NOT A REAL REQUEST **

Helo EMT,

This ticket is to request the completion of a self-service station visit.
Below are the details of this request.

Check Type: Accessory Rack (check 3 of 3)

Location: US-AST-DAT2-Accessory Rack A

Local Date: 2023-08-18

Please resolve one ticket per visit to the accessory rack, and update the worklog with the following details:
- Which items were out of stock?

Kind Regards,

EMT Services

e. Tickets are generated with the correct CTI and should not be changed.

Category

accessory rack

accessory restock

Approvals

2. Manage per normal standards (assignee set, worklog update, status usage)
- a. Assign one of the three tickets to the tech performing the work and set the status to **Work in Progress**.

b. Please find the list of items to add to the accessory carts at the [go/accessoryrack](#) [🔗](#) link.

c. Update the **worklog** with details of the check:

i. What was deployed/filled.

ii. No refill required.

iii. List any items are out of stock with ETA for restock.
3. Place the ticket into **Resolved** status at the time of the check, regardless of the outcome of the check.
4. Place the remaining 2 tickets in **Pending (Date of Event)** to be completed as the checks are executed.
5. Some sites are approved for less than [3 checks](#): [🔗](#)

a. For sites with 1 check/day, checks should occur midday.

b. For sites with 2 check/day, morning/late afternoon.

c. For sites with 3 checks a day, morning, midday, late afternoon.

d. Cases in which less than 3 checks are performed use canned responses. Select the message for the correct number of checks required, and paste into the worklog.

i. This accessory rack requires 2x daily checks. Resolving this ticket with no action taken.

ii. This accessory rack requires 1x daily check. Resolving this ticket with no action taken.

6. Resolve all tickets for completed checks by the end of each business day.

a. Tickets resolved regardless of the outcome of the check (out of stock, fully stocked, no refill required, etc).

7. Leave the ticket open for the site manager to act on if required checks are **NOT** performed. The EMT manager/supervisor must review the miss, update the worklog, and resolve the ticket.
- Manager Process
-
1. Perform a check for each site's completion at approximately 4pm local time to verify all rack checks have been completed and tickets have been resolved.

a. Create a custom search in GUTS for your location(s). Example:

core.requester:"guts-email-updater" AND core.group:"emt-a" AND core.requester_location:"US-AST" AND (core.status:Assigned OR core.status:"Work In Progress" OR core.status:Pending OR core.status:Resolved OR core.status:Closed) AND (summary: "Visit for")

2. Update the location highlighted in red to your supported rack/locker.

3. For any tickets still open, follow up with the onsite techs to determine if the check was completed.

a. If managers are able to verify that the check has been completed, have the tech complete the ticket.

b. If the physical check cannot be verified the ticket must remain open and will be counted as a miss. The following worklog update should be included in the ticket for any miss:

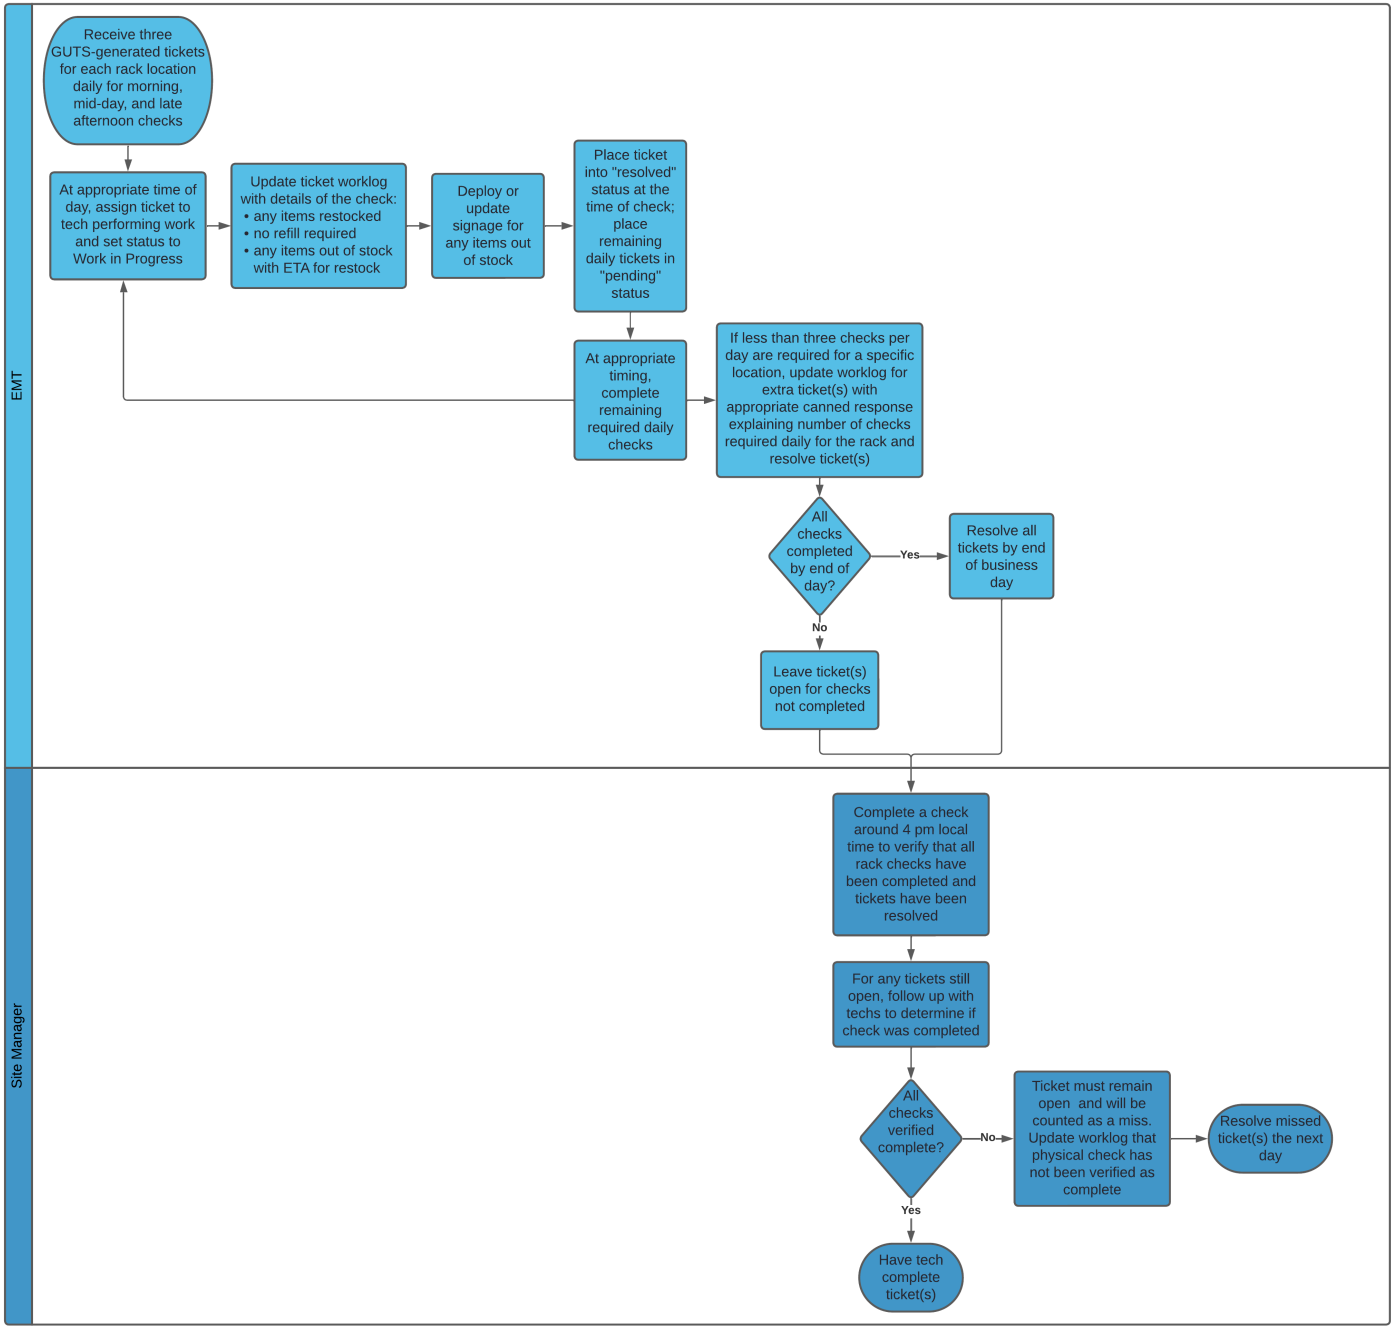

i. Unable to verify the physical check as complete. Resolving ticket.

c. Resolve the missed ticket the next day.

4. Perform regular ticket audits to confirm process is being followed

a. Provide techs with frequent reminders of the expectations

b. Incomplete checks due to unplanned office closure (natural disaster, etc) should be resolved the same day with a worklog update explaining the situation.
- Workflow

Self Check

Successful completion of this process includes:

- Accessory Rack stocked at the appropriate cadence.
- Tickets updated with appropriate response and resolved in the same day as the ticket was created.

Expected Resolution

Same Day resolution.
