Safety Guidelines	▼
-------------------	---

Context

The Internet of Things (IoT) assets are used to securely manage the IoT systems such as air-conditioning, fire alarms, central heating, etc., that are installed in the Google offices. The deployment of these IoT assets in the buildings is carried out upon request from the IoT project managers at Google. Field Service Technicians (FSTs) use these requests (tickets) to handle shipping, delivery, deployment, and setup of the requested IoT devices at the specified Google location.

Purpose

The main purpose of this document is to outline the IoT asset deployment process that includes handling requests, dispatching IoT bundles, configuration and imaging of assets.

Scope

This document guides Astreya Logistic Operations Center (LOC) technicians and onsite FSTs through the entire IoT deployment process. It includes:

- Processing IoT orders via GUTS tickets.
- Logistics handling (ordering, shipping, and queue transfer) via inventory team.
- Field activities by FST, including equipment allocation, asset imaging/configuration, physical deployment, and deployment checklist completion. This article does not provide any information related to troubleshooting procedures of deployed assets nor the long-term monitoring/maintenance of these assets. For further support, please refer to the playbook [Perform Break/Fix of IoT assets](#).

Process

1. When an IoT asset is required to be deployed, the regional L2 DSS technician or SME creates a **GUTS** child ticket (order ticket) that lists the additional hardware accessories to be supplied with IoT assets.
2. The inventory team self-assigns these order child tickets from the **emt-ordering** queue.
3. The inventory team ships the requested IoT bundle.
4. The inventory team transfers the child ticket to the **emt-a** queue once the IoT bundle is shipped.
5. The order ticket specifies the project code and the assignee details.
6. FST assigned in the ticket receives the IoT bundle as per [Serialized Asset Receiving](#).
7. The FST responsible must label all items within the IoT bundle with “**IoT**” and the corresponding order ticket number.

⚠ All the items within the IoT bundle must be stored separately and not be utilized for other regular deployments. The worklog must be updated to include the asset tag numbers of the devices.

8. FST resolves the order ticket and waits until the deploy ticket is created by the regional L2 DSS technician to initiate the deployment of assets.
9. Once everything is ready for the asset to be deployed, the regional L2 DSS technician creates the **GUTS** child ticket (deploy ticket) for the deployment of IoT assets that contains the configuration/imaging instructions of each IoT asset.

💡 The configuration/imaging of each IoT asset is different depending on many circumstances. The precise procedure that needs to be followed to image the asset will be included with each deployment ticket.

❗ Please note you will need a Windows laptop with admin access to set up the USB images. **Do NOT** reuse images from previous IoT requests/bundles.

10. The FST self-assigns the deploy ticket from the **emt-a** queue and deploys the IoT bundle at the specified location in the ticket.

❗ **Important:** If the IoT desktop is imaged in the LOC and then deployed to the location provided, confirm that the asset is connected to the network. Add a note in the worklog that “Network connection was verified at deployment”.

11. During deployment, if any issues arise, FST troubleshoots by coordinating with the requester (L2 DSS technicians/SMEs) for escalation and resolution.

12. Once the deployment is accomplished, FST completes the deployment checklist listed in the deploy ticket and resolve the ticket.
